EXPERTISE AND QUALITY

ALPHA is the result of a thirty-year cooperation between professionals and companies united by the know-how and the experience in the field of raw material processing and design for car wash equipment.

Together we have created a full range of accessories able to meet each customer needs thanks to the modularity of the structures and the versatility of the performance.

OUR STRENGTHS

DETAILS

All our machines are made with particular attention to the choice of quality components and the robustness of the frameworks.

Vacuums with self-cleaning compressor filter, management of the main models of electronic coin validators and cashless systems, padlockable coin container, 3-point lock, stainless steel hinge along the entire length of the door, seal gaskets, electronic control boards with MDB protocol to allow payment by credit card or smartphone.

CARE

- in design: thanks to the internal technical office with qualified staff and to the experience gained in this sector;
- in production: starting from steel and processing up to assembly and final configuration according to customer needs.
- in innovation: with the creation of new products, always at the forefront.

TELEMETRY (VIA CLOUD)

All the electronic control boards are designed by us to provide the best performance of our equipments.

The entry of telemetry in the boards arises from the desire to equip our machines with functions that allow the transmission of the operating data from remote control.

Data exchange takes place with WiFi technology: the electronic control board communicates with the CLOUD (data archive accessible through internet connection) via standard protocols, in a protected mode, that is with private key (password).

The function of the electronic board, besides managing 4 different selectable products (the list is vast - about a dozen of combinable solutions), is to continuously check the status of the machine and send any sign of anomalies to the CLOUD such as running out of product, activation of the emergency/stop button, scheduled maintenance interventions, alarms, accounting of payments, statistics, etc.

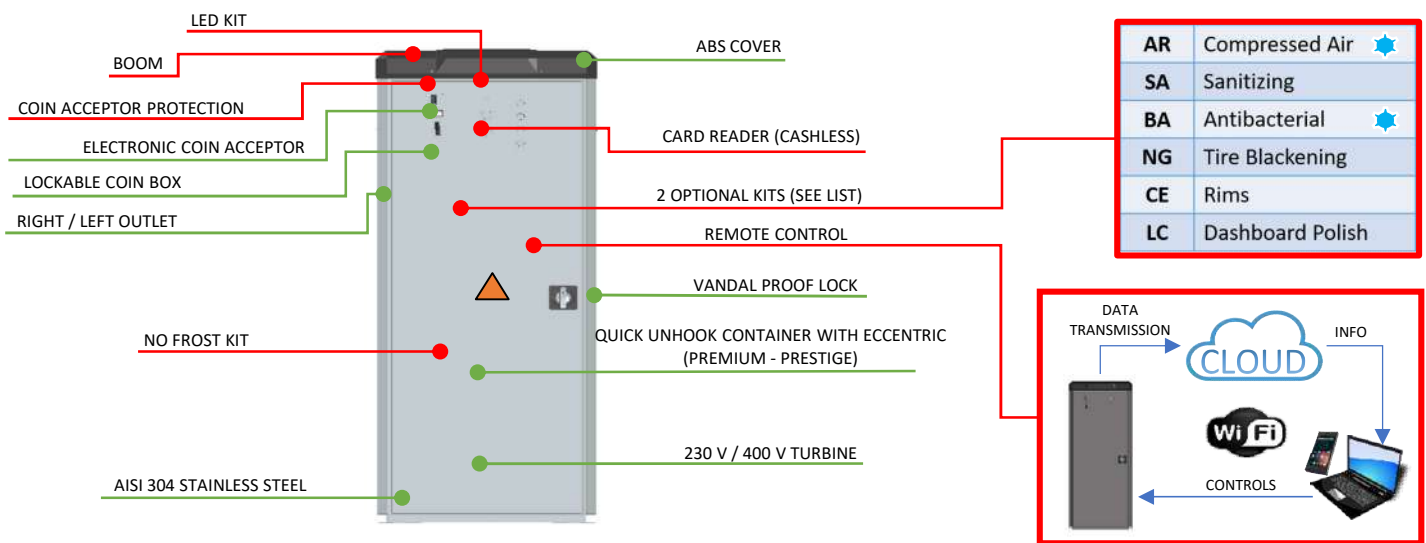

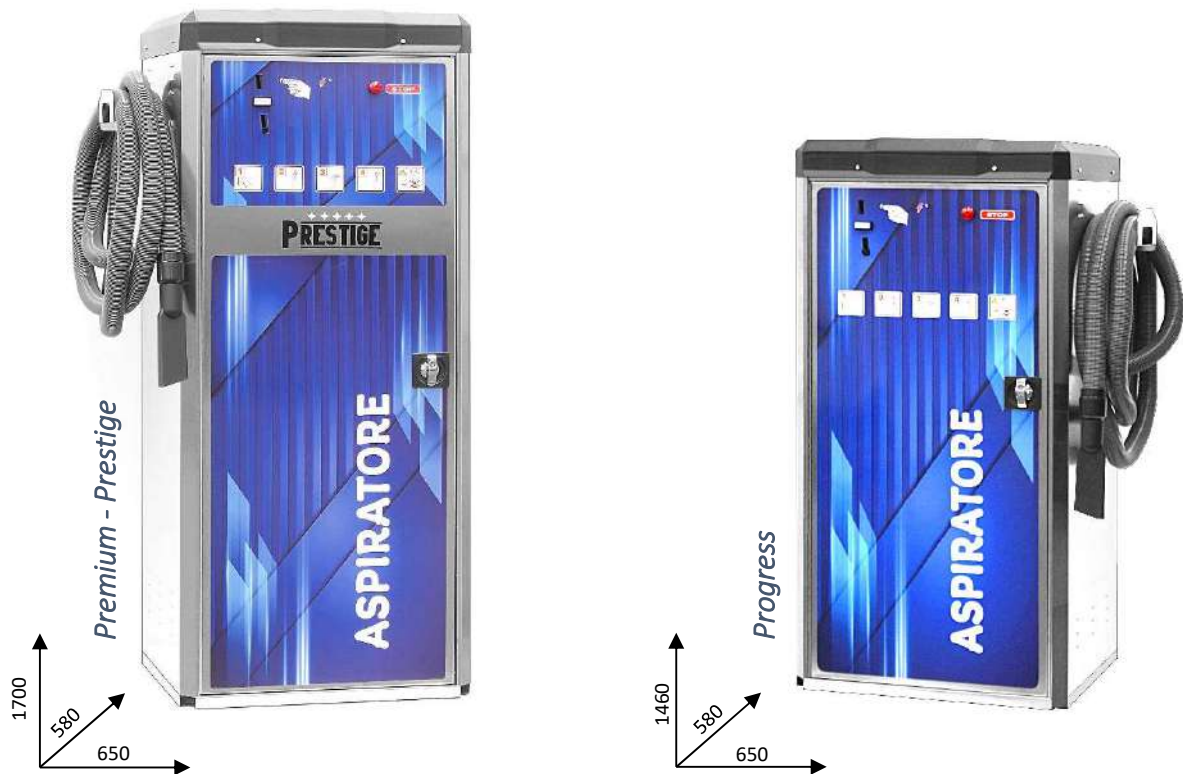

This information can be obtained according to the customer needs through the dashboard, laptop, or dedicated App.

A further important function is the transmission of different parameters to the machine than those previously set. The customer can change the price of the provided service, the time of use, the quantity of product, scheduled maintenance interventions, etc. Through the serial code of the control board it is possible to solve any problems directly in remote after-sales service mode.

FIRST

Aspirapolvere , Vacuum Cleaner , Sb-Sauger , Aspirateur , Aspirador
